

ONE DAY **BEFORE INTERVIEW**

@java_in.depth

ONE DAY BEFORE YOUR JAVA INTERVIEW.

SAVE THIS POST FOR YOUR NEXT
INTERVIEW 

1. REVISE CORE JAVA CONCEPTS

Before the interview, quickly revisit the fundamentals of Java. Most interviews still begin with core concepts like OOP, method overloading vs overriding, and the difference between `==` and `.equals()`.

You don't need deep theory at this point, just make sure you can explain these ideas clearly with simple examples.

2. REVIEW COLLECTIONS FRAMEWORK

Interviewers love questions about the Collections Framework. Focus on understanding when to use List, Set, and Map.

It's also helpful to remember the internal idea behind structures like HashMap, because many interviews ask why it performs faster than other data structures.

3. UNDERSTAND JVM BASICS

The Java Virtual Machine is responsible for running Java bytecode. Having a basic understanding of heap memory, stack memory, and garbage collection can help you answer many conceptual questions.

Even a simple explanation of how Java becomes platform-independent can leave a good impression.

4. PRACTICE A FEW CODING PROBLEMS

You don't need to solve dozens of problems the day before. Instead, practice a few common patterns involving arrays, strings, and hashing.

The goal is to keep your problem-solving mindset active so you can think clearly during the interview.

4. PRACTICE A FEW CODING PROBLEMS

Data Structures & Algorithms Cheat Sheet for Tech Interviews

Arrays

Collection of elements stored in-contiguous memory

- Two pointers
- Sliding window
- Sorting

Linked Lists

A sequence of elements where each element points to the next

- Reverse a linked list
- Detect a cycle
- Merge lists

Stacks & Queues

Algorithms are LIFO and FIFO

- Evaluate RPN
- Parentheses validation
- Implement cache

Trees

Hierarchical structures with parent/child relationships

- Binary tree
- Binary search tree
- Trie

Common, tree algorithms

- Tree traversal
- Lowest common ancestor
- Diameter of a tree

Searching

- Binary search
- Depth/Breadth-first search
- A* w/ heuristics

Sorting

- Quick sort
- Merge sort
- Heap sort
- Insertion sort
- Topological sort

5. REVIEW JAVA 8 FEATURES

Modern Java interviews almost always include features introduced after Java 8. Make sure you remember how lambdas simplify code and how streams process collections in a functional style.

Being comfortable explaining these features shows that you're familiar with modern Java development.

6. GO THROUGH YOUR PROJECTS

Interviewers often spend a lot of time discussing your projects. Be ready to explain the technologies you used, the challenges you faced, and how you solved them.

If your project uses frameworks like Spring Boot, understand how the architecture works.

6. GO THROUGH YOUR PROJECTS

7. PREPARE FOR BASIC SYSTEM DESIGN

Even junior developers may get simple system design questions. You might be asked how to design a REST API or structure a backend service.

Focus on explaining ideas clearly rather than drawing complex architectures.

8. BE READY TO EXPLAIN YOUR THINKING

Many candidates know the answer but struggle to explain their reasoning. During the interview, describe your thought process while solving problems.

Clear communication often matters as much as the final solution.

9. FINAL ADVICE

The day before an interview is not for learning entirely new topics. Focus on revising what you already know and staying calm.

Confidence, clear explanations, and solid fundamentals often matter more than memorizing every advanced concept.
